

Project Report: Service Selection Website

University of Northern Iowa Metal Casting & Foundry 4.0 Centers

Olivia Freund | 03/01/2025

Project Overview

A company required a website to showcase its available services, enable users to select any number of services, and calculate a subtotal based on their selections. The most effective approach involved developing an interactive webpage using HTML, CSS, and JavaScript. This project emphasized user-friendly design, dynamic interactivity, and real-time calculations to improve the customer experience.

Key Technologies Used:

- HTML (HyperText Markup Language) – Structured the website's content
- CSS (Cascading Style Sheets) – Styled and formatted the interface for a visually appealing design
- JavaScript – Enabled interactivity, including dynamic service selection and subtotal calculation
- Visual Studio Code – Used as the primary development environment

Learning & Technical Growth

Before this project, I had no prior experience with HTML or CSS. To bridge this gap, I studied *HTML & CSS: Design and Build Websites* by Jon Duckett, which helped me understand how HTML structures a webpage while CSS controls its presentation. Additionally, I explored JavaScript to introduce functionality, such as interactive service selection and a reset button, enhancing the user experience.

Challenges & Solutions

- Learning new technologies – Overcame this by leveraging structured resources like books and online documentation.
- Integrating JavaScript with HTML & CSS – Implemented fade-in transitions and a reset button for user convenience
- Ensuring a responsive and user-friendly design – Applied CSS techniques to improve layout and usability.

Future Opportunities

This company can use this website in the future to create more visibility and therefore generate more revenue. This is good for business and business practices.
